About Template Strings

In JavaScript, *template strings* allows for embedding expressions in strings, also referred to as string interpolation. This functionality extends the functionality of the built in `String` global object.

You can create template strings in JavaScript by wrapping text in backticks. They not only allow the text to include new lines and other special characters, you can also embed variables and other expressions.

```
const num1 = 1;
const num2 = 2;

`Adding ${num1} and ${num2} gi
// => Adding 1 and 2 gives 3.
```

Software Testing Guide

I grew up in the waterfall era, where testing was seen as a separate activity to programming, done by a different group of people, and carried out after programming was done. The shift towards iterative and agile approaches, particularly the influence of Extreme Programming, has changed the role of testing - raising its importance, and integrating it with the core development work.

At the core of my philosophy to testing is that we want to write self-testing code, meaning we have a suite of automated tests that be easily run against the code base. We should be confident that this suite will catch almost all bugs in the software, so that when this suite "goes green" (passes), we can release that version of the software into production. This kind of environment can both drastically improve the robustness of our software, but also enables us to use refactoring to improve our productivity and responsiveness in the coming months.

A guide to material on martinfowler.com about testing software systems.

Martin Fowler

2 Dec 2019

```tsx
describe("export", () ⇒ {
  beforeEach(async () ⇒ {
    await render(<ExcalidrawApp />);
  });

  it("export embedded png and reimport", async () ⇒ {
    const pngBlob = await API.loadFile("./fixtures/smiley.png");
    const pngBlobEmbedded = await encodePngMetadata({
      blob: pngBlob,
      metadata: serializeAsJSON(testElements, h.state),
    });
    API.drop(pngBlobEmbedded);

    await waitFor(() ⇒ {
      expect(h.elements).toEqual([
        expect.objectContaining({ type: "text", text: "😀" }),
      ]);
    });
  });
});
```

./src/test/export.test.tsx

error Command failed with exit code 137 · Issue #1177 …

With **yarn** instead of npm at 512 megs both servers started but if I navigated within the vue-ui gui site the dev server would crash. At 1GB I would see **errors** mentioning memory in the terminal of the dev server but it wouldn't crash. It seems that 2gb is enough for me but I think the switch from npm to **yarn** might have something to do with it.

○ https://support.infoworks.io › support › solutions › articles › 14000128220-pipeline-build-…

Pipeline build job fails with Exit code 137 in Yarn logs …

Exit code is **137**. Container exited with a non-zero exit code **137**. Root cause: This is an issue from the EMR side and this could happen if the spark.driver.memory or the spark.executor.memory values are very less. When a container (Spark executor) runs out of memory, **YARN** automatically kills it.
